Web-based Report Distribution for the Enterprise

Report.Web is a Web-based report solution that enables an automatic, reliable and secure distribution of business information. It functions as a centralized repository that can accept input files or reports from HP NonStop Servers, Windows, Unix or mainframe applications and publish them on a Microsoft IIS Server. With a standard Web Browser, users can search, view, print or save reports from anywhere on the Intranet or Internet.

Data in the reports can be selectively converted to useful formats such as PDF, Excel, XML or Tree View. All these can be accomplished with no programming or modification to existing applications. With Report.Web, corporations realize a quick return on investment with the savings in time and cost of printing and delivery, in addition to more timely

The Report.Web Process

TIC partners with ASG to bring you Report.Web

delivery of business information and increase of user satisfaction.

Benefits of using Report.Web:

Eliminate looking up information in paper or file reports by accessing all data from a central repository via the Web

Secure reports against unauthorized access with Windows or LDAP authentication

Intuitive Web User interface to access information easily from anywhere on the Intranet or Internet

More timely access to information via Email notification of report availability

Increase User satisfaction with timely availability of new reports

Automatic conversion to Excel saves time and money, and eliminate potential data entry mistakes

Reduces costs in printing and delivery of reports

Automatic archival to CD removes costly storage system or reruns of old reports

Some of our Customers:
